

CareChart Configuration and User Guide

A plain-language handbook for hospital setup, staff training, and daily operations

PREPARED FOR Hospital administrators and authorized staff	EDITION Customer edition - August 2026
SCOPE CareChart outpatient workflows	SCREENSHOTS Demonstration data only; identifiers removed or replaced

Privacy-safe customer edition: The screenshots in this guide are flattened demonstration images. Patient names, MRNs, phone numbers, dates of birth, staff emails, order identifiers, clinical narratives, payment links, and audit identifiers were removed or replaced before the images were embedded.

How to use this guide: Administrators should begin with hospital setup and role access. Other staff can go directly to the section matching their daily work.

1. What CareChart does

CareChart brings common outpatient hospital tasks into one hospital-scoped workspace. It connects patient registration, appointments, the doctor's queue, clinical documentation, diagnostic orders, patient records, documents, billing, and audit history.

Figure 1. Public landing page with links for booking, patient access, and staff sign-in.

The top navigation

Area	Plain-language purpose
Front Desk	Find or register patients and start walk-in visits.
Schedule	Book appointments and check patients in.
Doctor's Desk	Review requests, open the waiting room, and document visits.
Patient Records	Search the hospital's patient history.
Admin	Create hospital accounts, invite staff, and manage roles.
Billing	Generate invoices and record payments, refunds, and voids.

Area	Plain-language purpose
Diagnostics	Start lab/radiology work, upload reports, and track review.
Documents	Upload approved patient PDFs and images.
Audit	Review important security and workflow events.
Settings	Configure clinics, practitioners, schedules, prices, and tax.

2. Sign in, passwords, and the active hospital

Sign in

1. Open the staff sign-in page.
2. Enter the email address assigned to your individual account.
3. Enter your password and select Sign in.
4. If you cannot remember the password, use Forgot password? and follow the approved reset process.

The screenshot shows the CareChart staff sign-in interface. At the top is the CareChart logo. Below it is an 'EMAIL' label followed by a text input field containing 'user@example.com'. Underneath is a 'PASSWORD' label followed by a masked password input field. To the right of the password field is a 'Forgot password?' link. A large green 'Sign in' button is centered below the fields. At the bottom, there are two links: 'New here? Create an account' and 'Patient? Open patient portal'. A light green banner at the very bottom states 'DEMONSTRATION SCREEN · IDENTIFIERS REMOVED OR REPLACED'.

Figure 2. Staff sign-in screen using demonstration credentials.

Password rule: A new password must contain at least 8 characters, including at least one letter and one number. Never share a password or use one account for several people.

Active hospital

The hospital shown at the top of the screen is the active hospital. Data entered or viewed on that screen belongs to that hospital workspace.

- Super Admin users can open Active Hospital and switch between hospital accounts they manage.
- Other staff see only the hospital or hospitals to which they are assigned.
- Always confirm the hospital name before registering a patient, changing settings, or creating an invoice.

Important: Changing the active hospital changes the workspace. It does not move patients, visits, staff, invoices, or configuration between hospitals.

3. Roles and access

CareChart shows only the menus allowed for the signed-in role. An administrator should give each person the smallest role needed for their job.

Role	Typical access
Super Admin	All hospital workspaces, hospital creation, active-hospital switching, and all operational areas.
Admin / Clinic Admin	Hospital administration, settings, records, billing, diagnostics, documents, and audit.
Doctor	Schedule, Doctor's Desk, records, diagnostics, and documents.
Front Desk / Reception	Patient registration, schedule, records, billing support, and documents.
Nurse	Schedule, patient records, and documents.
Billing	Billing and patient-record lookup needed for finance work.
Lab / Radiology	Diagnostics, patient-record lookup, and documents needed for report workflows.
Patient	The separate patient portal connected only to that patient's account.

Role changes: Role changes take effect for future access. Remove or suspend access promptly when a person leaves or no longer needs the system.

4. Front Desk: find or register a patient

Find an existing patient

1. Open Front Desk.
2. Search using the MRN, patient name, or phone number.
3. Check more than one detail before selecting a result. This helps prevent choosing the wrong person.
4. If no correct record exists, select Register new patient.

Figure 3. Front Desk search before a patient is selected.

Register a new patient

1. Enter the patient's full name exactly as provided.
2. Enter date of birth when available; confirm that the calculated age is correct.
3. Choose gender and the doctor responsible for the visit.
4. Enter phone, email, blood group, emergency contact, and address when collected under hospital policy.
5. Add known allergies carefully. Press Enter after each allergy so it is saved as a separate item.
6. Review the information with the patient, then select Save patient & continue to visit.

Figure 4. Empty New Patient Registration form.

Duplicate prevention: Search before registering. If two records may belong to the same person, stop and ask an administrator to use the approved duplicate-review process. Do not casually delete a patient record.

5. Appointments and check-in

Book from the schedule

1. Open Schedule and choose the required date.
2. Select New appointment.
3. Search for and select the patient.
4. Choose the doctor, time, visit duration, and reason.
5. Select Book appointment.
6. When the patient arrives, open the appointment and complete check-in so the visit reaches the doctor's queue.

DEMONSTRATION SCREEN - IDENTIFIERS REMOVED OR REPLACED

Figure 6. New appointment form.

Online appointment requests

- A public request is not a completed visit. It must be reviewed and confirmed by authorized staff.
- The doctor or authorized team reviews the requested date and time before confirmation.
- After confirmation, Front Desk checks the patient in when they arrive.

6. Doctor's Desk and waiting room

Doctor's Desk brings together appointment requests, confirmed online appointments, and patients waiting for consultation.

1. Review any appointment requests awaiting action.
2. Confirm or decline according to the hospital's booking process.
3. Open a patient from Waiting Room only when ready to begin the consultation.
4. Confirm the patient and visit reason before documenting anything.

Figure 7. Doctor's Desk with a demonstration waiting-room entry.

7. Document a clinical visit

Complete the consultation

1. Confirm the patient header and review any allergy alert before prescribing.
2. Read the chief complaint and record measured vital signs.
3. Enter examination findings or clinical feedback.
4. Record the diagnosis and advice given to the patient.
5. Add medicines and tests when clinically appropriate.
6. Create a tracked diagnostic order when the lab or radiology team must receive and process the request.
7. Save a draft if the visit is not ready. Otherwise confirm the signature checkbox and select Complete & sign visit.

The screenshot shows the CareChart interface for a 'Sample Patient' (Adult - DEMO-0001). The top navigation bar includes 'Front Desk', 'Schedule', 'Doctor's Desk' (active), 'Patient Records', 'Admin', 'Billing', 'Diagnostics', 'Documents', 'Audit', and 'Settings'. The user is logged in as 'Super Admin - SUPER_ADMIN' with a 'Sign out' link. The consultation form contains the following sections:

- Sample Patient**: Adult - DEMO-0001 - identifiers removed. Buttons: Print report, Back to queue.
- No known allergies**: A green bar indicating no allergies.
- Chief complaint**: Example complaint. **Vitals**: Enter measured values.
- View 1 previous visit**: A link to view the previous visit.
- EXAMINATION NOTES / DOCTOR'S FEEDBACK**: A text area containing 'Example examination notes for training only.'
- DIAGNOSIS**: A text area containing 'Example diagnosis'.
- ADVICE TO PATIENT**: A text area containing 'Example advice. Follow the hospital's approved clinical process.'
- PRESCRIPTION**: A section with a '+ Add medicine' button.

A footer note states: 'DEMONSTRATION SCREEN - IDENTIFIERS REMOVED OR REPLACED'.

Figure 8. Consultation form using demonstration text only.

Clinical responsibility: CareChart records information and displays alerts. It does not replace professional judgement. The signing clinician remains responsible for accuracy, appropriateness, and follow-up.

Tests, diagnostic orders, and signature

The figure consists of two side-by-side screenshots of the CareChart interface. The left screenshot shows the 'TESTS ORDERED' section. It has a search bar with the placeholder 'e.g. Complete Blood Count' and a '+ Add' button. Below this is the 'OPERATIONAL DIAGNOSTIC ORDERS' section, which includes a 'Laboratory' dropdown menu, a 'Routine' dropdown menu, and fields for 'Procedure name', 'Procedure/code (optional)', 'Schedule (optional)', and 'Clinical indication'. A 'Create diagnostic order' button is prominently displayed. Below the button, there is a list of example orders: 'Example laboratory order A' (DEMO-ORDER-001 - REVIEWED), 'Example laboratory order B' (DEMO-ORDER-002 - IN_PROGRESS), 'Example laboratory order C' (DEMO-ORDER-003 - IN_PROGRESS), and 'Example laboratory order D' (DEMO-ORDER-004 - IN_PROGRESS). The right screenshot shows the 'IMAGING ORDER (SENDS HL7 TO MODALITY WORKLIST)' section. It includes a dropdown for 'X-Ray', a text field for 'Procedure (e.g. Cervical Spine 2 Views)', and a text field for 'Body part (optional)'. A 'Send order to modality workload' button is located below these fields. Below the button, there is a 'DOCTOR'S SIGNATURE' section with the text 'Signing as Super Admin' and a checkbox for 'I confirm this consultation record is accurate and digitally sign it.'. At the bottom right of this section are two buttons: 'Save draft' and 'Complete & sign visit'. Both screenshots have a footer that reads 'DEMONSTRATION SCREEN - IDENTIFIERS REMOVED OR REPLACED'.

Figure 9. Left: tracked operational diagnostic orders. Right: draft and digital-signature controls.

- Tests ordered is a simple clinical list recorded in the visit.
- Operational diagnostic orders create work for the Diagnostics team and support report upload and review tracking.
- Save draft keeps the visit open. Complete & sign visit finalizes the encounter for downstream records and billing.
- A correction after signing should follow the approved amendment process so the original remains traceable.

8. Patient Records

1. Open Patient Records.
2. Search by MRN, patient name, or phone number.
3. Select the correct patient after verifying more than one identifier.
4. Review permitted demographics, allergies, previous visits, diagnoses, medicines, tests, documents, and signed information.

Figure 10. Patient Records list using demonstration identities.

Minimum necessary access: Open a patient record only when it is needed for your assigned work. Searching or viewing a record can be recorded in the audit history.

9. Hospital and staff administration

Create a hospital account - Super Admin

1. Open Admin and confirm the active hospital shown in the header.
2. Under Create Hospital Account, enter the hospital or clinic name.
3. Enter the first administrator's name and email.
4. Set a temporary password that follows the password rule.
5. Select Create hospital.
6. Open Active Hospital and switch into the new hospital before configuring it.

The screenshot shows the 'Admin' page of the CareChart system. At the top, the header includes the CareChart logo, 'Demo Hospital', and the user 'Super Admin · SUPER_ADMIN' with a 'Sign out' link. A navigation bar contains links for Front Desk, Schedule, Doctor's Desk, Patient Records, Admin (active), Billing, Diagnostics, Documents, Audit, and Settings.

The main content area is titled 'Admin' and includes the description: 'Invite staff, approve join requests, and manage roles for Demo Hospital.' Below this are three sections:

- CREATE HOSPITAL ACCOUNT:** A form with four input fields: 'HOSPITAL / CLINIC NAME', 'ADMINISTRATOR NAME', 'ADMINISTRATOR EMAIL', and 'TEMPORARY PASSWORD'. A 'Create hospital' button is to the right.
- INVITE STAFF BY EMAIL:** A form with an 'EMAIL' input field (containing 'name@example.com'), a 'ROLE' dropdown menu (set to 'Front Desk'), and a 'Send invite' button.
- ADD USER MANUALLY:** A section with a '+ Add user' button.
- PENDING JOIN REQUESTS (0):** A section showing 'No pending requests.'

A footer note at the bottom states: 'DEMONSTRATION SCREEN - IDENTIFIERS REMOVED OR REPLACED'.

Figure 11. Admin page for hospital creation, staff invitations, and user management.

Invite or add staff

- Invite by email when the person should create their own password through the approved invitation process.
- Add user manually only when the hospital's onboarding process requires an administrator-created account.
- Choose the role carefully. The role controls which menus and records the person can access.
- Administrator email and password fields should be entered manually; they must not copy the signed-in user's credentials automatically.

Review active staff

Figure 12. Active staff list using demonstration names and emails.

1. Review active staff regularly.
2. Change a role only after confirming the person's current duties.
3. Use Remove when access should end, following the hospital's offboarding policy.
4. Never reuse a former employee's account for a new employee.

10. Billing, invoices, and payments

Generate and review invoices

1. Complete and sign the clinical visit.
2. Open Billing and choose the completed visit or invoice.
3. Review the patient, invoice status, date, line items, unit price, discount, tax, and total.
4. If a price is zero unexpectedly, stop before collecting money and configure the matching service price under Settings.
5. Save changes only after the invoice is correct.

- Record payment: enter the amount, method, and optional reference used by the hospital.
- Partial payment: the invoice remains partly unpaid until the balance is collected.
- Refund: enter the refund amount and a clear reason; the original payment remains traceable.
- Void invoice: use only when the invoice should be cancelled. A reason is required.
- Print: produce a customer-facing invoice copy through the approved printing process.

11. Diagnostics: collection, report upload, and doctor review

Lab or radiology team

1. Open Diagnostics and filter by type or status when needed.
2. For a blood test, begin the collection process when the sample is actually received. For imaging, begin processing according to the department workflow.
3. Complete the test or imaging work in the hospital's approved laboratory or radiology system.
4. When the final report is ready, attach the approved PDF, JPEG, or PNG file to the in-progress order.
5. Select Upload report & send to doctor. The order becomes ready for clinical review.

Figure 16. Diagnostics page using fictional orders, patient, clinician, and report name.

Ordering clinician

1. Open the completed order.
2. Open and read the attached report.
3. When clinically satisfied, acknowledge the report using the available review control.
4. Arrange any required patient follow-up outside the status change itself.

Status meaning: Completed means a report was uploaded. Reviewed means an authorized clinician opened and acknowledged it. A status is not a substitute for reading the report.

12. Patient documents

1. Open Documents.
2. Search for the patient and verify the correct record.
3. Choose an approved PDF, JPEG, or PNG file.
4. Link it to a diagnostic order when the document is the final report for that order; otherwise keep it as a general patient document.
5. Select Upload securely.
6. Authorized staff can later open or download the document within the same hospital workspace.

Figure 17. Patient Documents search screen.

Before uploading: Confirm the patient, document type, and hospital. Do not upload unrelated files, passwords, exports containing multiple patients, or documents not approved by hospital policy.

13. Audit history

Audit history is an append-only record of important security and workflow events for the active hospital. It can show the time, action, resource, user or system identifier, and reason when one was supplied.

Demo timestamp	DOCUMENT_UPLOADED	Demo resource	Demo user	—

DEMONSTRATION SCREEN - IDENTIFIERS REMOVED OR REPLACED

Figure 18. Audit history using demonstration timestamps and identifiers.

- Use audit history for authorized operational, privacy, security, and support reviews.
- Do not put passwords, tokens, or unnecessary clinical details into an audit reason.
- An audit event shows that an action occurred; it does not by itself explain whether the action was clinically appropriate.

14. Configure a hospital in the recommended order

Start here: Switch to the correct active hospital before every configuration step. Configuration belongs only to that hospital workspace.

Step 1 - Locations and departments

1. Open Settings.
2. Enter the clinic name, a unique clinic code, address, and IANA timezone such as Asia/Kolkata.
3. Select Add clinic.
4. Choose the clinic, select Department, enter the department name, and add the configuration.
5. Repeat for each real care location and department.

The screenshot shows the CareChart Demo Hospital interface. The top navigation bar includes the logo, hospital name, and user information. The main menu has icons for Front Desk, Schedule, Doctor's Desk, Patient Records, Admin, Billing, Diagnostics, Documents, Audit, and Settings. The Settings page is titled 'Clinic configuration' with a subtitle 'Configure care locations, clinician availability, billable services, and tax rules.' The 'Locations and departments' section contains two forms. The first form has fields for CLINIC NAME, CLINIC CODE (BLR01), ADDRESS, and IANA TIMEZONE (Asia/Kolkata), followed by an 'Add clinic' button. The second form has a 'CLINIC' dropdown (Select clinic), a 'CONFIGURATION TYPE' dropdown (Department), and a 'NAME' field, followed by an 'Add configuration' button. A footer note states 'DEMONSTRATION SCREEN - IDENTIFIERS REMOVED OR REPLACED'.

Figure 19. Clinic, location, and department configuration.

Step 2 - Practitioners and weekly schedules

1. Select the doctor account and the clinic where the doctor works.
2. Choose the department and enter specialty, qualification, and registration number when required.
3. Select Save practitioner.
4. Choose the practitioner and weekday, then enter start time, end time, and slot length.
5. Add a break only when both break start and break end are entered.
6. Select Save Weekly Schedule. Saving the same practitioner and weekday updates the existing entry instead of creating a duplicate.

02:00 PM

Remove break

Save weekly schedule

DEMONSTRATION SCREEN · IDENTIFIERS REMOVED OR REPLACED

Figure 20. Practitioner profile and weekly schedule configuration.

Step 3 - Blocked time and holidays

- Blocked practitioner time is for leave, meetings, or another period when one practitioner is unavailable.
- Clinic holiday is for a date when the selected clinic is closed.
- Enter a clear reason or holiday name so staff understand why slots are unavailable.

Step 4 - Service catalog, prices, and tax

- Choose the clinic.
- Enter a stable service code and service name that match how the service will appear on invoices.
- Choose the category, such as Consultation, Medicine, Test, or Imaging.
- Enter the clinic price. Mark Taxable service only when approved by the hospital's finance process.
- Select Save service and price.
- If tax applies, choose the clinic, enter the tax name and rate, set the effective date, and add the tax rule.

The screenshot displays three configuration sections in the CareChart interface:

- Block practitioner time:** Includes fields for PRACTITIONER (dropdown), REASON (text), STARTS (date/time), ENDS (date/time), and a green 'Add blocked time' button.
- Add clinic holiday:** Includes fields for CLINIC (dropdown), HOLIDAY NAME (text), and a green 'Add holiday' button.
- Service catalog, prices, and tax:** A larger section with fields for CLINIC (dropdown), SERVICE CODE (text), SERVICE NAME (text), CATEGORY (dropdown), CLINIC PRICE (₹) (text), TAXABLE service (checkbox), CLINIC (dropdown), TAX NAME (text), RATE PERCENT (text), and EFFECTIVE FROM (date). It features a green 'Save service and price' button and a green 'Add tax rule' button.

A footer bar at the bottom reads: DEMONSTRATION SCREEN · IDENTIFIERS REMOVED OR REPLACED

Figure 21. Blocked time, holidays, service pricing, and tax configuration.

Why prices matter: Invoice prices are populated by matching visit items to the active clinic's service catalog. A missing or mismatched service can leave the invoice price at zero.

15. Public booking and patient portal

Public appointment booking

- The public page can link a patient to the appointment request form.
- The patient chooses an available hospital, clinic, doctor, date, and time according to the deployed booking workflow.
- A request enters the review queue and becomes confirmed only after authorized review.

Patient portal

- The patient uses the separate patient portal entry point, not the staff sign-in form.
- Activation must follow the hospital's identity-verification process.

- A portal user should see only the patient record connected to that portal account.
- Staff must verify the patient's email and identity before sending or renewing access.

16. New hospital setup checklist

- Hospital account created and selected as the active hospital
- Clinic locations, codes, addresses, and timezones entered
- Departments and appointment types created
- Doctor accounts linked to practitioner profiles
- Every working weekday, slot length, and optional break checked
- Planned leave, blocked periods, and clinic holidays entered
- Common consultations, medicines, tests, and imaging services priced for each clinic
- Tax rules reviewed and approved by the hospital's finance owner
- Staff invited with the smallest role required
- Email delivery, document storage, encryption, malware scanning, backups, and HTTPS tested
- A complete fictional-patient workflow tested before entering real patient information

Go-live approval: Technical availability does not replace hospital approval. Clinical, operational, privacy, legal, security, and finance owners should approve the configured workflow before real use.

17. Daily workflow checklists

Walk-in visit

1. Front Desk searches for or registers the patient.
2. Front Desk logs the visit and selects the doctor.
3. Doctor opens the patient from Waiting Room.
4. Doctor documents, orders, and signs the visit.
5. Lab or radiology processes any tracked order and uploads the final report.
6. Ordering clinician reviews and acknowledges the report.
7. Billing reviews prices, generates the invoice, and records payment.

Online appointment

1. Patient submits a public appointment request.
2. Authorized staff or doctor reviews and confirms it.
3. Front Desk checks the patient in on arrival.
4. Clinical, diagnostic, record, and billing steps follow the same controlled workflow as a walk-in visit.

18. Privacy, security, and safe documentation

- Use an individual account. Never share passwords or leave a signed-in device unattended.
- Confirm the active hospital and patient before viewing, entering, uploading, printing, or billing information.
- Access only the minimum information needed for assigned work.
- Do not include patient information in training material, sales documents, screenshots, support messages, or presentations unless formally approved and securely de-identified.
- Use fictional identities for demonstrations. A common-looking name is not automatically de-identified.
- Remove staff emails, internal IDs, tokens, and environment details from customer-facing screenshots.
- Use approved storage, encryption, malware scanning, backups, HTTPS, access review, incident response, and retention procedures.
- Follow applicable hospital policy and legal/regulatory requirements for the country and care setting.

Screenshot rule: A customer guide should contain only screenshots that were deliberately prepared for demonstration. Cropping is not enough when the original file still contains hidden or out-of-frame sensitive pixels; use a flattened sanitized copy.

19. Troubleshooting

Problem	What to check
Wrong hospital is shown	Super Admin: open Active Hospital and switch. Other staff: confirm assignment to the correct hospital.
A menu is missing	Check the signed-in role. CareChart hides functions that are outside the role's access.
Patient is not found	Confirm the active hospital and search using another approved identifier. Do not create a duplicate without checking.
Doctor is missing from scheduling	Confirm an active doctor account is linked to a practitioner profile and clinic.
No appointment slots appear	Check weekday schedule, slot length, breaks, blocked time, holidays, and existing appointments.
Same weekday appears twice	Save the same practitioner and weekday again to update it. Ask support to review older duplicate data if it remains.
Password is rejected	Use at least 8 characters with at least one letter and one number.
Invoice price is zero	Create or correct the active service and clinic price in Settings, then follow the approved invoice-correction process.
Report cannot be uploaded	Confirm the order is in progress and the file is an approved PDF, JPEG, or PNG within the configured size limit.
Doctor cannot acknowledge report	Confirm the report is completed and the user is the ordering clinician or an authorized administrator.
Page remains on Loading	Refresh once. If application assets return errors, contact the implementation/support team with the page and time.

Information safe to send support

- Page name and approximate time of the issue
- Your role and the hospital name shown in the header
- The non-sensitive error message
- Steps that led to the issue and whether it remains after a refresh
- A screenshot only after patient information, credentials, tokens, emails, IDs, and internal URLs are removed

20. Plain-language glossary

Term	Meaning
Active hospital	The hospital workspace currently selected at the top of the screen.
Appointment type	A named kind of visit with a standard duration.
Audit event	A time-stamped record that an important action happened.
Clinical indication	The reason a test or imaging procedure is requested.
Completed diagnostic order	A final report was uploaded and is waiting for clinical review.
Department	A care grouping inside a clinic, such as General Medicine or Pediatrics.
Encounter / visit	The clinical record for one patient attendance or consultation.
IANA timezone	A standard location-based timezone name, such as Asia/Kolkata.
MRN	Medical Record Number - the patient's identifier inside one hospital.
Organization	The hospital-level workspace that separates one customer's data from another's.
Practitioner profile	The configuration linking a clinician account to clinic, department, and scheduling details.
Reviewed diagnostic order	An authorized clinician opened and acknowledged the uploaded report.
Service catalog	The hospital's list of billable services and clinic prices.
Tenant scoped	Restricted to one hospital workspace rather than shared across hospitals.

Guide maintenance: Update this handbook whenever screens, roles, workflows, password rules, or integrations change. Recreate customer screenshots with fictional demonstration data and repeat the privacy review before distribution.
